These proteins can be used to develop viral vaccines, antisense nucleic acids, ribozymes and other antiviral agents. They can also be used in xeno-transplantation technology and as diagnostic tools.

```

The present invention relates to a method for screening a cell or tissue for the presence or expression of a retrovirus (RV), comprising contacting a target nucleic acid from the cell or tissue with a second nucleic acid from the present invention (e.g. the present sequence or a graft transplantation risk. Screening of animals allows the elimination of domors with active replication of known viruses. Inactive proviruses of domors with active replication of known viruses. Inactive proviruses of potential human pathogens derived from swine in a manner not in the outbred human organ donor population and is important to can be detected and inactivated, allowing Claim 1; Fig 2; 127pp; English. or miniature swine retroviral genome Assessing risk of endogenous retroviruses in clinical practice and in xenotransplantation, comprises using probe sequences derived from swi identification and elimination from swine possible
